The NCCLS (now known as the CLSI [Clinical and Laboratory Standards Institute]) defines an antibiogram (ABGM) as an overall profile of antimicrobial susceptibility results of a microbial species to a battery of antimicrobial agents (17), which should reflect patient care needs along with the institution's formulary (15).

Editorial Note: *S. pneumoniae* strains resistant to fluoroquinolones are uncommon, but development of resistance is a concern (9). If the new NCCLS susceptibility breakpoints promote using narrower-spectrum antibiotics to treat pneumococcal disease, development of resistance to

broader-spectrum antibiotics might be slowed.

Systems), five wells contain the antibiotic ceftiofur with dilutions of 8, 4, 2, 1, 0.5 and 0.25 µg/ml and four wells contain spectinomycin with dilutions of 64, 32, 16 and 8 µg/ml, respectively. After 18-24 hours, the plates are examined either visually or with an analytical instrument for evidence of bacterial growth.
