Knowing the difference between parametric and nonparametric test will help you chose the best test for your research. A statistical test, in which specific assumptions are made about the population parameter is known as parametric test. A statistical test used in the case of non-metric independent variables, is called nonparametric test.

Difference Between Parametric and Nonparametric Test (with ...

Hypothesis Testing with Nonparametric Tests. In nonparametric tests, the hypotheses are not about population parameters (e.g., $\mu=50$ or $\mu_1 = \mu_2$). Instead, the null hypothesis is more general. For example, when comparing two independent groups in terms of a continuous outcome, the null hypothesis in a parametric test is $H_0: \mu_1 = \mu_2$.

When to Use a Nonparametric Test - Boston University

Nonparametric statistics is the branch of statistics that is not based solely on parametrized families

of probability distributions (common examples of parameters are the mean and variance). Nonparametric statistics is based on either being distribution-free or having a specified distribution but with the distribution's parameters unspecified.

Non-Parametric Hypothesis Testing Paper - Research Paper ...

Nonparametric methods may lack power as compared with more traditional approaches . This is a particular concern if the sample size is small or if the assumptions for the corresponding parametric method (e.g. Normality of the data) hold. Nonparametric methods are geared toward hypothesis testing rather than estimation of effects.
